EXECUTIVE SUMMARY

AWN Consulting was requested by ESB International to undertake a site investigation and prepare an assessment of the hydrogeology at the proposed 400/110 kV substation and compound area (98 x 117m) in the town land of Coolnabacky' near Portlaoise Co. Laois. Building foundations will be at a maximum 2.5m below ground level (bgl). .

A number of tufa deposits and springs on historical maps have been identified in the vicinity of the site. The tufa deposits identified are associated with field drains and it appears , based on field observations, the deposits are fed by a constant supply of calcium carbonate rich groundwater. These spring-fed watercourses are the headwaters of the Timahoe River which flows into the River Barrow and Nore Special Areas of Conservation (SAC) ca 4.5 km to the South-West. The Timahoe River is designated as part of the SAC.

The bedrock geology underlying the site consists of the Ballyadams Formation of crinoidal wackestone/packstone limestone and is classified as a Regionally Important Aquifer (RKd). Gravel deposits are also present in the area which will also act as an aquifer when sufficiently thick, permeable, saturated and extensive. The site is located on the boundary of a defined Locally Important sand and gravel aquifer. The aquifers beneath the proposed Coolnabacky substation are classified by the Geological Survey of Ireland as having a moderate vulnerability, indicating the presence of 5-10m of clayey subsoil beneath the site. The vulnerability rating was confirmed locally by investigations on the site undertaken in 2012 and 2013.

Site investigations show that clayey Sand and Gravel deposits were encountered in the 2012 investigation towards the centre of the site, and range from 0.9m to 1.9m bgl. The locations of the groundwater monitoring wells drilled in 2013 around the boundary of the site did not encounter sand and gravel or any groundwater strikes. Clay deposits were proved to a depth of 8.5m bgl.

Permeability tests carried out in each the groundwater monitoring well indicate that the hydraulic conductivity is typical of silt and clay soils. Therefore, the water present in the deposits represents pore water, rather than groundwater. The Sand and Gravel deposits at the centre of the site, which would be expected to have a higher permeability, were found to be unsaturated during the 2012 site investigation. Water levels in the groundwater monitoring wells are c.1m bgl.

The water environment receptors include groundwater beneath the site, tufa deposits, field drains and watercourses and the Timahoe River. The potential impact from any short term dewatering required during construction is expected to be limited. This is because the 2012 site investigation results indicate that the Sand and Gravel deposits are not saturated where present and groundwater inflow is not significant. Any minor dewatering which may be required will therefore be confined to the area immediately surrounding the excavation and will not impact on the tufa deposits or springs. Clay has been proved to 8.5m bgl and so any near surface sand and gravel deposits at the site will not be in hydraulic continuity with the bedrock aquifer.

Mitigation measures recommended include isolating any groundwater in the more permeable Sand and Gravel deposits during dewatering if necessary, provision of a 25m buffer zone around the tufa deposits and ensuring that mitigation measures from Section 10.0 (Water of the Environmental Impact Statement (EIS) are implemented.

1.0 INTRODUCTION

AWN Consulting was requested by ESB International to undertake a Site Investigation and prepare an assessment of the underlying hydrogeology at the proposed 400/110 kV GIS substation in the town land of Coolnabacky, near Portlaoise Co. Laois.

The following list of maps and publications, together with databases, were reviewed as part of the assessment:

- Geological Survey of Ireland (GSI)/Teagasc Soils Map, Online Map Database¹
- GSI, Geology of Kildare-Wicklow, Sheet 16²
- Karst Database, GSI¹
- Quaternary (Subsoils) Database, GSI¹
- Groundwater Well Database, GSI¹
- Ground Investigation Report, Coolnabacky 400kV Substation³,
- GSI, Bagnelstown Groundwater Body Characterisation⁴,
- GSI, Kyle & Orchard Springs, Groundwater Source Protection Zones⁵,
- EPA, Kyle PWS, Water Framework Directive Groundwater Monitoring Programme⁶.

4No. groundwater monitoring wells were drilled and installed at the substation site to provide further site specific data on the ground conditions and collect groundwater level data in the immediate vicinity of the substation, 400kV tower and the settlement ponds. The boreholes were located around the site boundary. See Appendix A for borehole locations.

Ground conditions were logged during drilling and falling/rising head tests were completed following drilling to estimate hydraulic conductivity. Boreholes and groundwater levels were surveyed relative to OD and water level information is collected at regular intervals via data loggers on an on-going basis.

1.1 Site Description

The proposed Coolnabacky substation is situated approximately 2.5km north of Timahoe, Co. Laois. The site consists of a large roughly rectangular field where the proposed substation is planned and another field through which the proposed site access route is planned. The site area is level and is presently being used as agricultural land. The access route rises towards the south west over its length by circa 15m.

The fields were separated by deep ditches containing water and mature trees. A number of tufa deposits and springs on historical maps have been identified in the vicinity of the site. The tufa deposits identified are associated with field drains.

Based on field observations it appears that the watercourses and field drains surrounding the Coolnabacky substation site are fed by a supply of calcium carbonate rich groundwater. These spring-fed watercourses are the headwaters of the Timahoe River which flows into the River Barrow and Nore SAC ca 4.5 km to the South-West. The Timahoe River is designated as part of the SAC.

1.2 Surrounding Land Uses

The site is bordered by a disused quarry to the south west and agricultural land in all other directions.

1.3 Proposed Works

The proposed works consists of a 400kV substation and compound area (98m x 117m). Building foundations will be maximum 2.5m. The footprint size of the proposed buildings will be:

- 400 kV Building - 15.5m x 63.5m
- 110 kV Building - 11.3m x 50m
- Trafo bunds - 10.7m x 79m

The proposed development will also seek modifications to the existing access road approximately (1.2km), connection to 400 kV line via overhead line to gantry in compound to double circuit end mast and connection of 110 kV lines via cable from the 110 kV building in compound to the line/cable interface masts.

1.4 Disclaimer

The findings and opinions expressed in this report are based on the information available at the time the report was prepared and interpretation is based on design details available such as foundation depths. If additional information becomes available, which might alter AWN's conclusions, we reserve the right to review such information, reassess potential concerns and modify our opinions, if warranted. Please note that where we refer to information in reports from others, it must be recognised that AWN has no responsibility for the accuracy of the information contained therein.

This report has been prepared by AWN for ESBi International. Any third party using this Report does so entirely at their own risk. AWN makes no warranty or representation whatsoever, express or implied, with respect to the use by a third party of any information contained in this Report or its suitability for any purpose. AWN assumes no responsibility for any costs, claims, damages or expenses (including any consequential damages) resulting from the use of this Report or any information contained in this Report by a third party.

2.0 RECEIVING ENVIRONMENT

A summary of the receiving environment is provided in the following sections.

2.1 Soils

The soil and subsoil underneath the proposed substation consists of undifferentiated alluvium (see Figures 2.1 and 2.2).

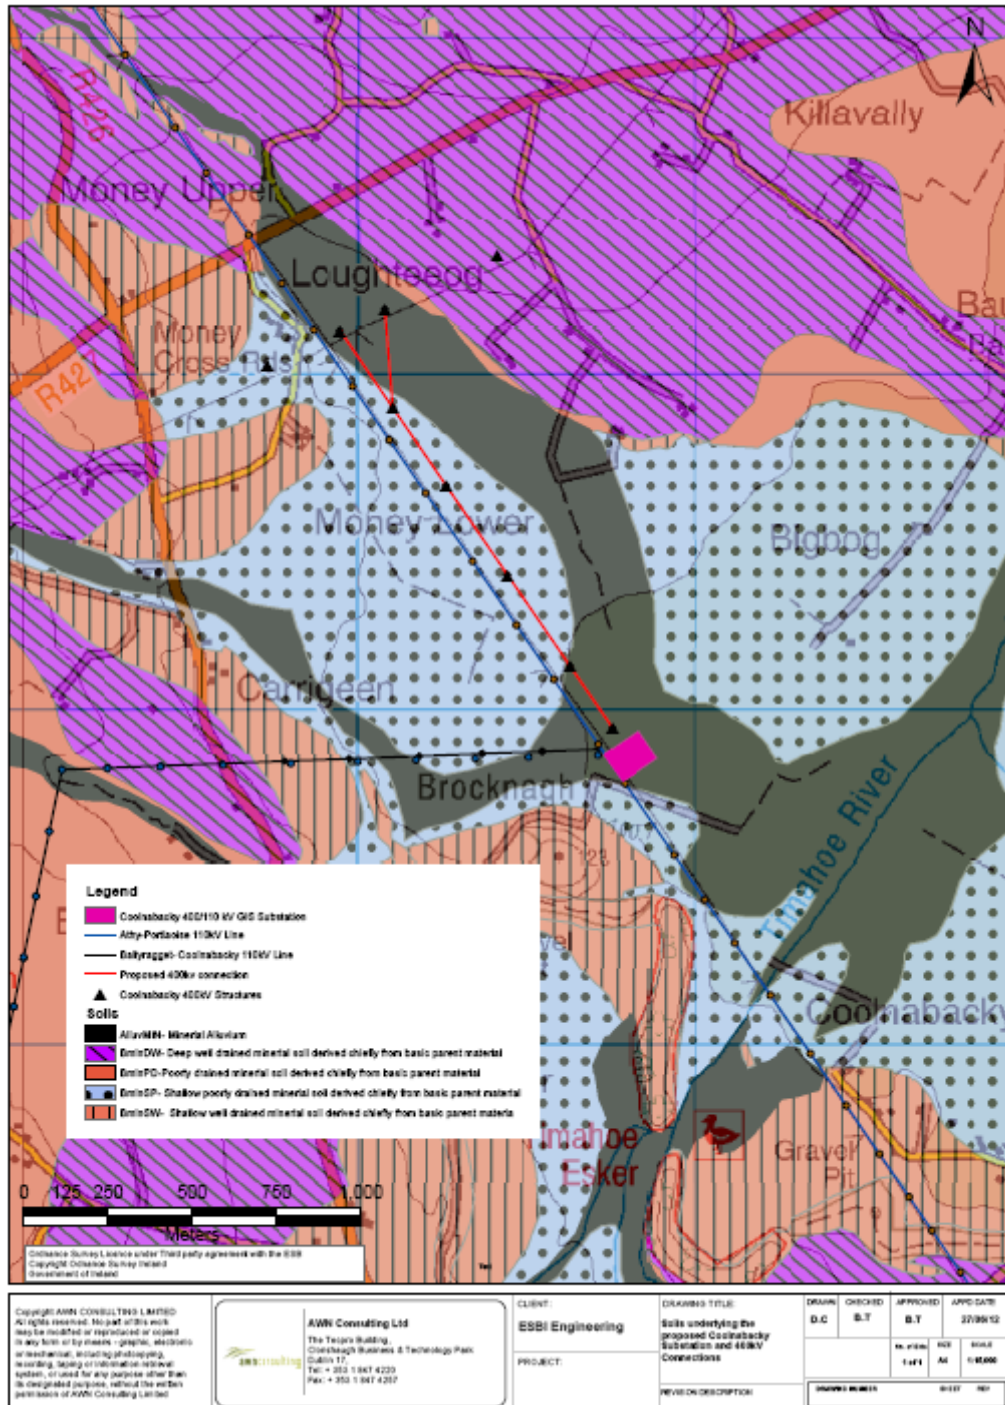

Figure 2.1 Soils underlying the proposed Coolnabackey Substation

Alluvial subsoil consists of gravel, sand, silt or clay in a variety of mixes and usually consists of a fairly high percentage of organic carbon (10%-30%). Alluvium is mapped only on modern day river floodplains. The alluvial deposits are usually

bedded, consisting of many complex strata of waterlain material left both by the flooding of rivers over their floodplains and the meandering of rivers across their valleys.

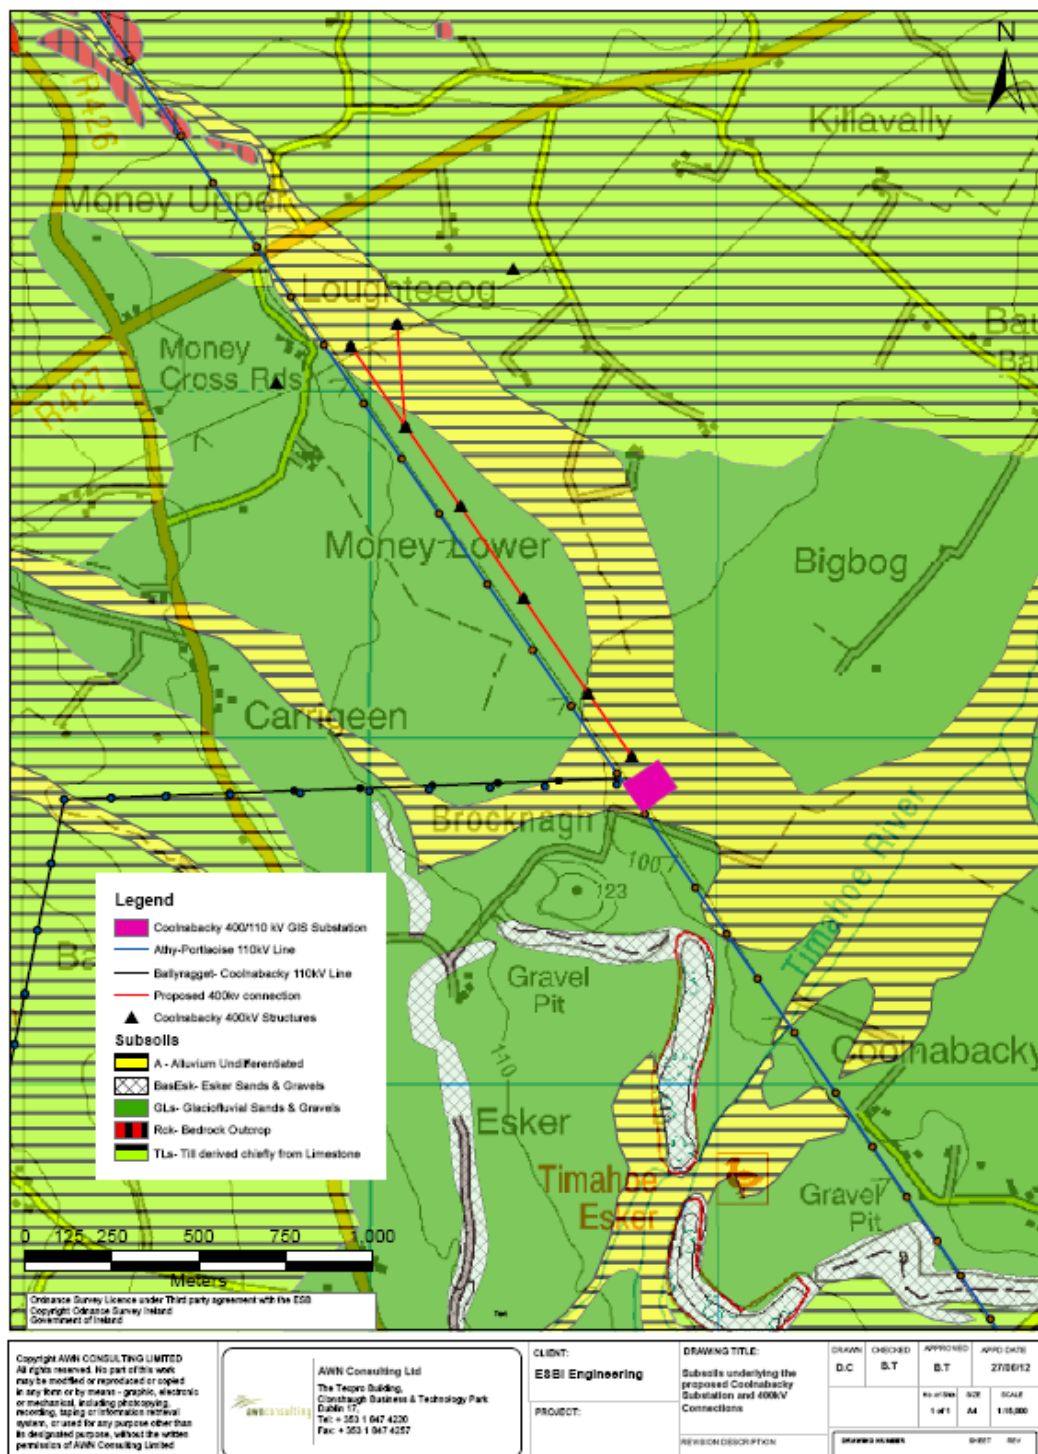

Figure 2.2

Subsoils underlying the proposed Coolnabackey Substation

2.2 Bedrock Geology

The bedrock geology underlying the site consists of the Ballyadams Formation of crinoidal wackestone/packstone limestone (see Figure 2.3).

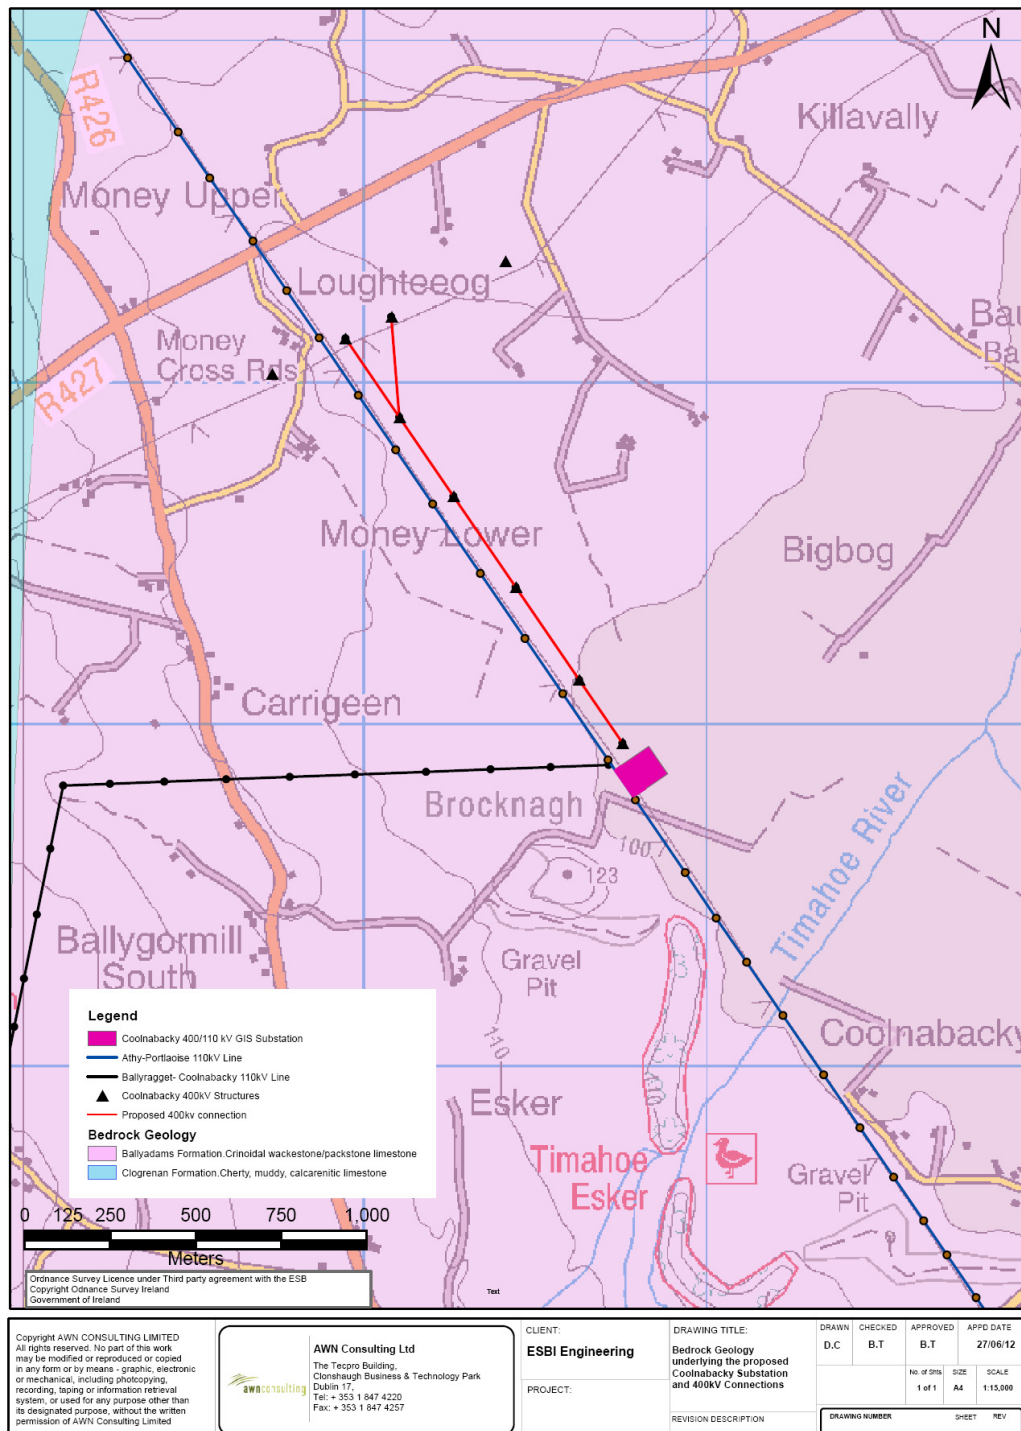

Figure 2.3 Bedrock Geology underlying the proposed Coolnabackey Substation

The Ballyadams Formation consists of pale-grey thick-bedded pure fossiliferous limestone. It comprises water-bearing units of pure limestone and dolomitised limestone and Calp. The dolomitisation is not complete and therefore there may be areas of undolomitised limestone that act as aquitards.

2.3 GSI Boreholes and Springs

The closest boreholes recorded by the GSI, are approximately 1.5km and 1.8km north east of the site. The wells are both shallow (5.5m bgl and 7m bgl) and the yield is classified as poor.

The Kyle Spring is located approximately 2km to the south east of the site and is used as a public water supply, with an abstraction rate of 1,591m³/d. The spring is a source protection zone⁵ and is part of the EPA's Groundwater Monitoring Programme⁶. The spring is situated in gravels. The source protection zone of the spring is located approximately 1.2km from the site at its nearest point. See Figure 2.4.

Figure 2.4 Proximity to Source Protection Zone

2.4 Aquifer Classification

The bedrock aquifer is classified as a Regionally Important Aquifer (RKd), referring to the Ballyadams Formation (see Figure 2.5).

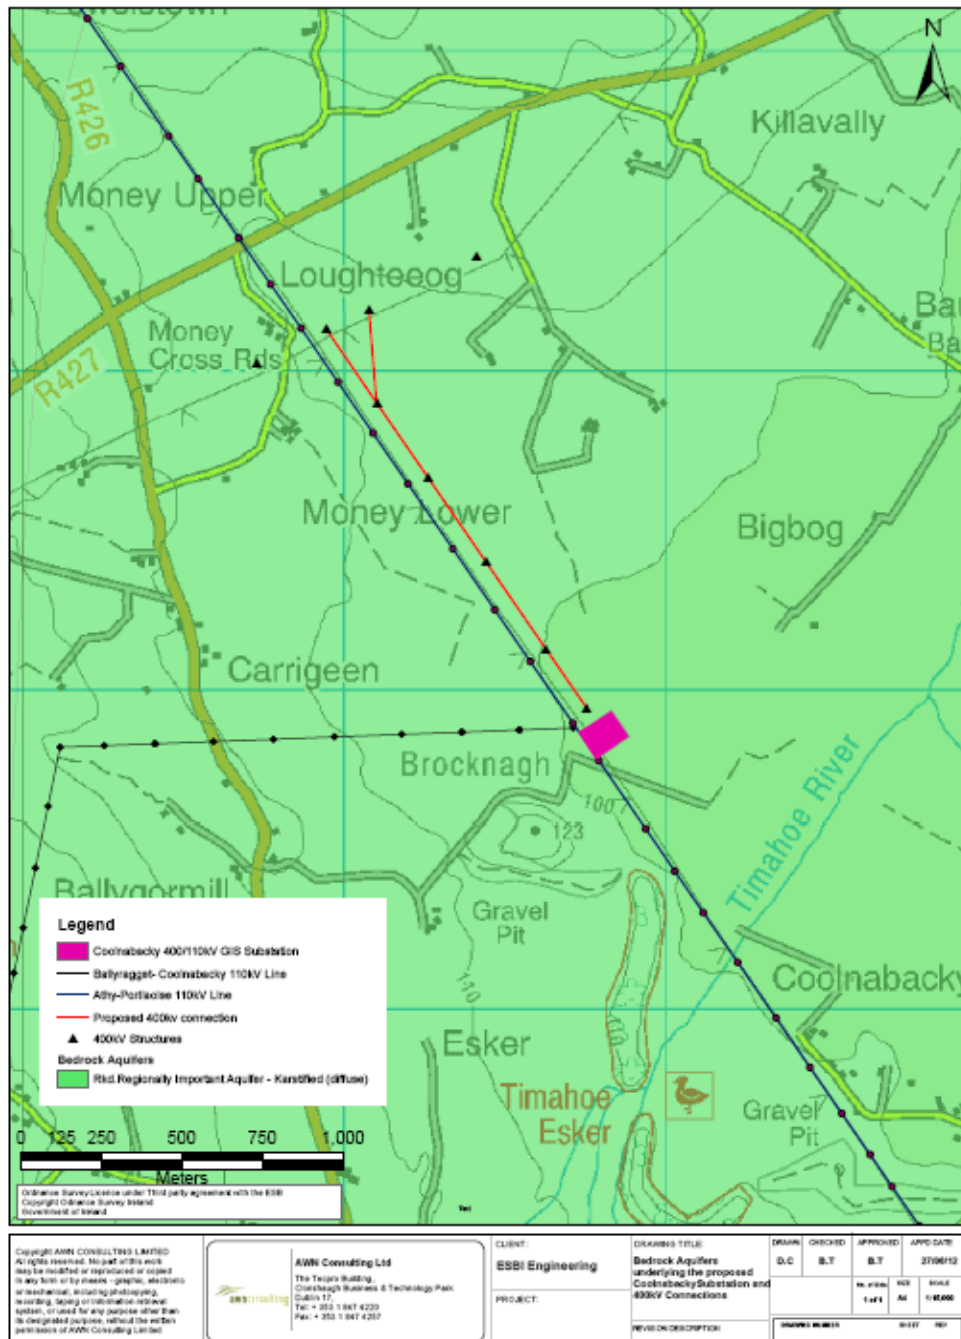

Figure 2.5 Bedrock Aquifers underlying the proposed Coolnabackey Substation

Gravel deposits are also present in the area which will also act as an aquifer when sufficiently thick, permeable, saturated and extensive. The proposed Coolnabackey substation is located on the boundary of a defined Locally Important sand and gravel aquifer (see Figure 2.6). The tufa deposits to the east of the substation are also on the boundary of the gravel aquifer. The gravel aquifer is shown to extend to the south west of the site, where eskers and gravel pits are noted.

Figure 2.6 Gravel Aquifers underlying the proposed Coolnabackey Substation

2.5 Groundwater Vulnerability

The aquifers beneath the proposed Coolnabacky substation are classified as having a moderate vulnerability (see Figure 2.7), indicating the presence of 5-10m of clayey subsoil beneath the site, as shown in the GSI's vulnerability mapping guidelines shown in Table 2.1.

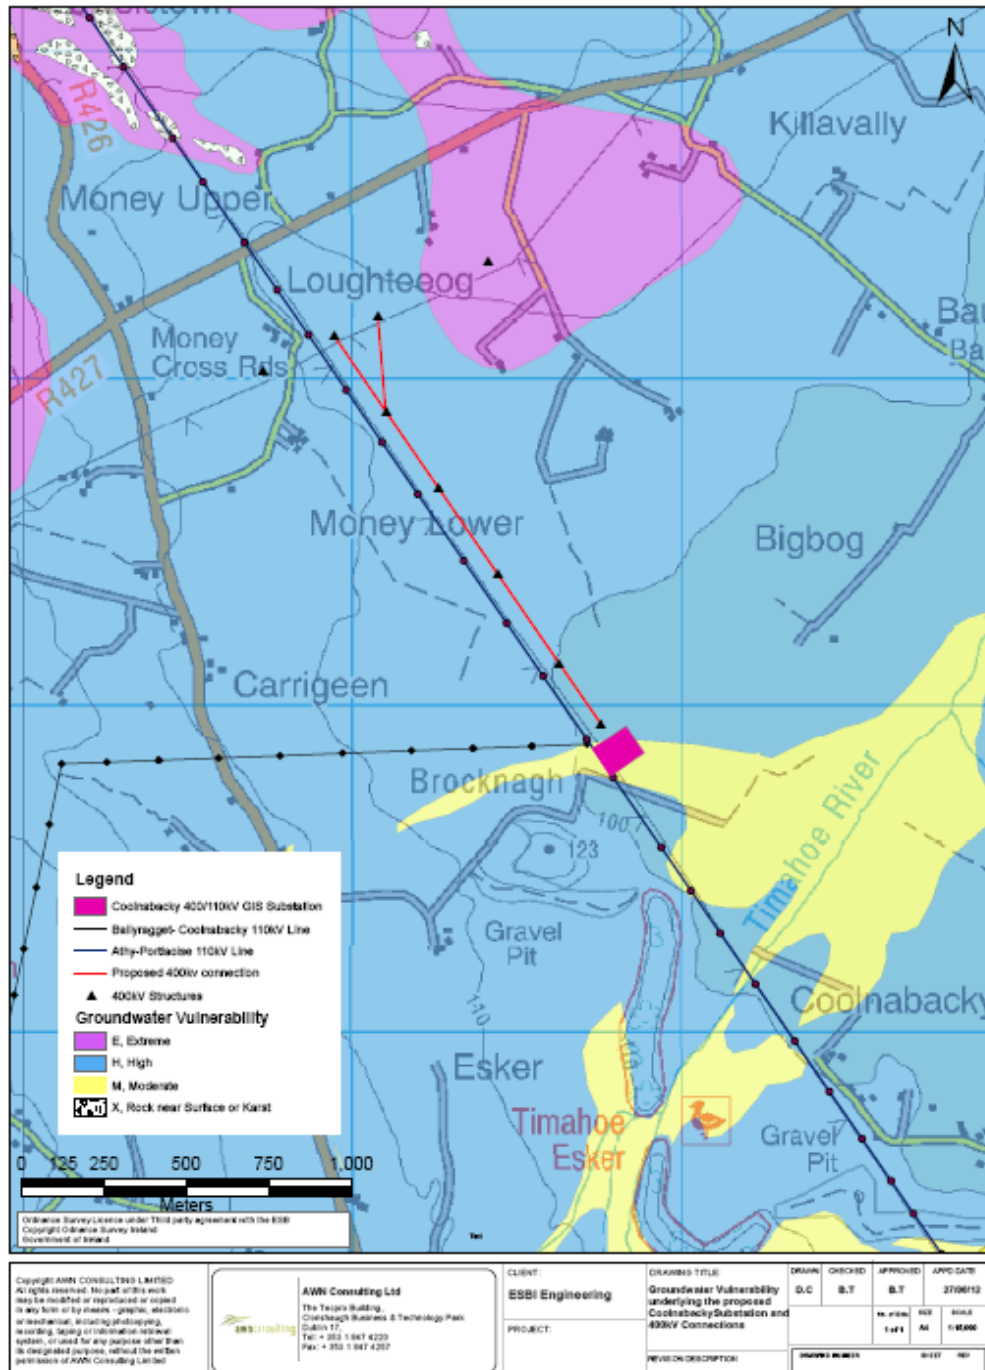

Figure 2.7 Groundwater Vulnerability underlying the proposed Coolnabacky Substation

The substation is surrounded by areas of high vulnerability (see Figure 2.7).

Vulnerability Rating	Hydrogeological Conditions				
	Subsoil Permeability (Type) and Thickness			Unsaturated Zone	Karst Features
	High permeability (sand/gravel)	Moderate permeability (e.g. Sandy subsoil)	Low permeability (e.g. Clayey subsoil, clay, peat)	(Sand/gravel aquifers only)	(<30 m radius)
Extreme (E)	0 - 3.0m	0 - 3.0m	0 - 3.0m	0 - 3.0m	-
High (H)	> 3.0m	3.0 - 10.0m	3.0 - 5.0m	> 3.0m	N/A
Moderate (M)	N/A	> 10.0m	5.0 - 10.0m	N/A	N/A
Low (L)	N/A	N/A	> 10.0m	N/A	N/A
Notes: (1) N/A = not applicable. (2) Precise permeability values cannot be given at present. (3) Release point of contaminants is assumed to be 1-2 m below ground surface.					

Table 2.1 Vulnerability Mapping Guidelines

2.6 Groundwater Flow Direction

The nearest large river is the Timahoe river, approximately 600m to the south east of the site (see Figure 4.1). The groundwater flow direction is assumed to be to the south east.

2.7 Groundwater Body

The site is underlain by the Bagenalstown Groundwater Body (GWB). The GSI has issued a Summary of Initial Characterisation for the Bagenalstown GWB⁴.

Sands and gravels overlie significant areas of this groundwater body and are themselves discrete groundwater bodies. The sands and gravels are very coarse and poorly sorted and are similar to those seen in the Nore Basin. Clay layers often separate individual layers of the sands and gravels. In other areas, Till derived from limestone is the dominant overlying material.

The dolomite aquifer is presumed to be of “replacement” origin and hence may contain some primary permeability. The dominant secondary permeability of the dolomite results from the development of fissures by the solution of bedding planes and joints. In the undolomitised pure limestones only secondary permeability exists. The transmissivity of the dolomites can range from 20-200m²/d, with a specific yield less than 2% (storage coefficient 10⁻⁴).

There is hydraulic continuity between the Barrow Valley sands and gravels and the underlying aquifer. Under natural non-pumping conditions the flow regime in the aquifer is severely restricted, as there is no natural discharge down-dip. Hence the aquifer will be full of water and circulation will be limited to the near surface zone. Under pumping conditions leakage will occur from the sands and gravels into the aquifer.

3.0 SITE INVESTIGATIONS

A site investigation was carried out at the site by Soil Mechanics in 2012 and includes a series of boreholes (BH1 – BH8) located at the substation compound area³. These boreholes are located towards the centre of the site.

monitoring further site investigation and groundwater monitoring was undertaken in 2013 and the borehole locations and borehole logs are presented in Appendix A. 4 No. groundwater monitoring wells were installed at the substation site close to the site boundary to provide further site specific data on the underlying aquifer properties and collect groundwater level data in the immediate vicinity of the substation, 400kV tower and the settlement ponds.

The ground conditions encountered during each Site Investigation and described in the following sections:

3.1 2012 Soil Mechanics Site Investigation

Topsoil

Topsoil was encountered from ground level to a maximum depth of 0.3m bgl. Topsoil was encountered at all locations.

Superficial Deposits

Clayey Sand and Gravel deposits were encountered at many of the locations beneath the topsoil at the centre of the site to between 0.9m to 1.9m bgl. The Sand and Gravel deposits are typically described as light brown to orange brown with sub rounded cobbles of limestone. Sand and Gravel deposits were encountered at all locations. Gravelly Clay was encountered at other locations to up to 1.2m bgl.

Clay deposits were encountered from 0.9m bgl and proved to a maximum depth of 8.5m bgl (BH2). Between 2.7m to 6.8m of clay was proved in the boreholes. The clay consisted of grey to brown grey firm to stiff clay with sub rounded gravel and cobbles of limestone. The clay became very stiff in some locations with depth. Clay deposits were encountered at all locations.

Bedrock was not encountered at the site.

Groundwater

Groundwater strikes were encountered in all boreholes other than BH1 and BH10. The groundwater strikes were encountered in both the Sand and Gravel and gravelly Clay deposits. Where groundwater was encountered, the strikes were recorded at depths of between 0.8m bgl (BH3) and 5.2m bgl (BH7). No groundwater inflows were noted in BH2, BH3 and BH5.

It is noted that groundwater was encountered in the Sand and Gravel deposits at borehole BH3 only, indicating that the Sand and Gravel is not saturated.

3.2 2013 Groundwater Monitoring Site Investigation

Topsoil

Topsoil was encountered from ground level to a maximum depth of 0.3m bgl. Topsoil was encountered at all locations.

Superficial Deposits

Ground conditions encountered during the drilling works consisted of soft to firm gravelly clayey Sand and sandy gravelly Clay to a maximum depth of 2.7m bgl. Below this, stiff sandy gravelly Clay was encountered, and was proven to a maximum depth of 8.6m bgl.

Bedrock

Borehole BH4 was extended to depth to investigate the thickness of the superficial deposits. Stiff sandy gravelly Clay was found to extend to 8.6m bgl when returns were of angular rock, indicating the possible presence of bedrock.

Groundwater

No groundwater strikes were encountered in any of the four boreholes. Damp strata was noted in the top three metres in the gravelly clayey Sand and sandy gravelly Clay strata. The underlying stiff sandy gravelly Clay was dry. Groundwater levels recorded indicated that the depth to groundwater is c.1m bgl.

Groundwater levels recorded in the installations are presented in Table 3.1.

Borehole No.	Ground Level	Cover Level	Depth of Groundwater					
			24th May 2013		19th June 2013		30th June 2013	
	(mAOD)	(mAOD)	(mbgl)	(mAOD)	(mbgl)	(mAOD)	(mbgl)	(mAOD)
BH1	99.38	99.85	1.015	98.365	1.091	98.289	1.14	98.24
BH2	98.95	99.41	0.945	98.005	0.985	97.965	0.96	97.99
BH3	98.1	98.51	1.908*	96.192	1.05	97.05	1.07	97.03
BH4	97.48	97.94	0.638	96.842	0.962	96.518	1.03	96.45

* borehole just drilled

Table 3.1 Groundwater Levels Recorded

Data loggers were placed in all four boreholes. The groundwater levels recorded are presented in Appendix B.

3.3 Permeability Tests

Falling and rising head tests were carried out in all four boreholes on 19th June 2013. See Table 3.2. The permeability test sheets and method are included in Appendix C.

Borehole	Rising Head Test		Falling Head Test	
	m/s	m/d	m/s	m/d
BH1	3.0×10^{-6}	0.26	3.5×10^{-6}	0.30
BH2	6.3×10^{-6}	0.54	2.8×10^{-6}	0.25
BH3	7.9×10^{-6}	0.69	2.0×10^{-6}	0.17

Table 3.2 Permeability Test Results

The hydraulic conductivity of boreholes BH1 – BH3 ranged from 0.26 – 0.69 m/d. This is within the range of hydraulic conductivity for silt, which is 10^{-3} – 1 m/d (Misstear, 2007)⁷.

The hydraulic conductivity of the boreholes is also similar to the default properties used in the UK Environment Agency's CLEA model for clay soil of 0.8m/d (CLEA Briefing Note 2: Version 1.1, July 2004)⁸.

Borehole BH4 showed no response to the rising head test and very little response to the falling head test, indicating that the permeability is particularly low in this borehole.

The permeability tests indicate that the hydraulic conductivity is typical of silt and clay soils. Therefore, the water present in the deposits at the groundwater wells represents pore water, rather than groundwater.

The EPA guidance on Guidance on the Authorisation of Discharges to Groundwater⁹, states that pore water in low permeability sediments (e.g. clays and clayey till) is excluded from the definition of groundwater in the Groundwater Regulations, as such groundwater does not represent a usable groundwater resource for water supply.

3.4 Groundwater Flow Direction

The permeability tests indicate that the hydraulic conductivity of the soils is typical of silt and clay soils, indicating that the groundwater present in the wells represents pore water. Where pore water is present in low permeability deposits, it may not be feasible to define a water table as lateral movement is impeded.

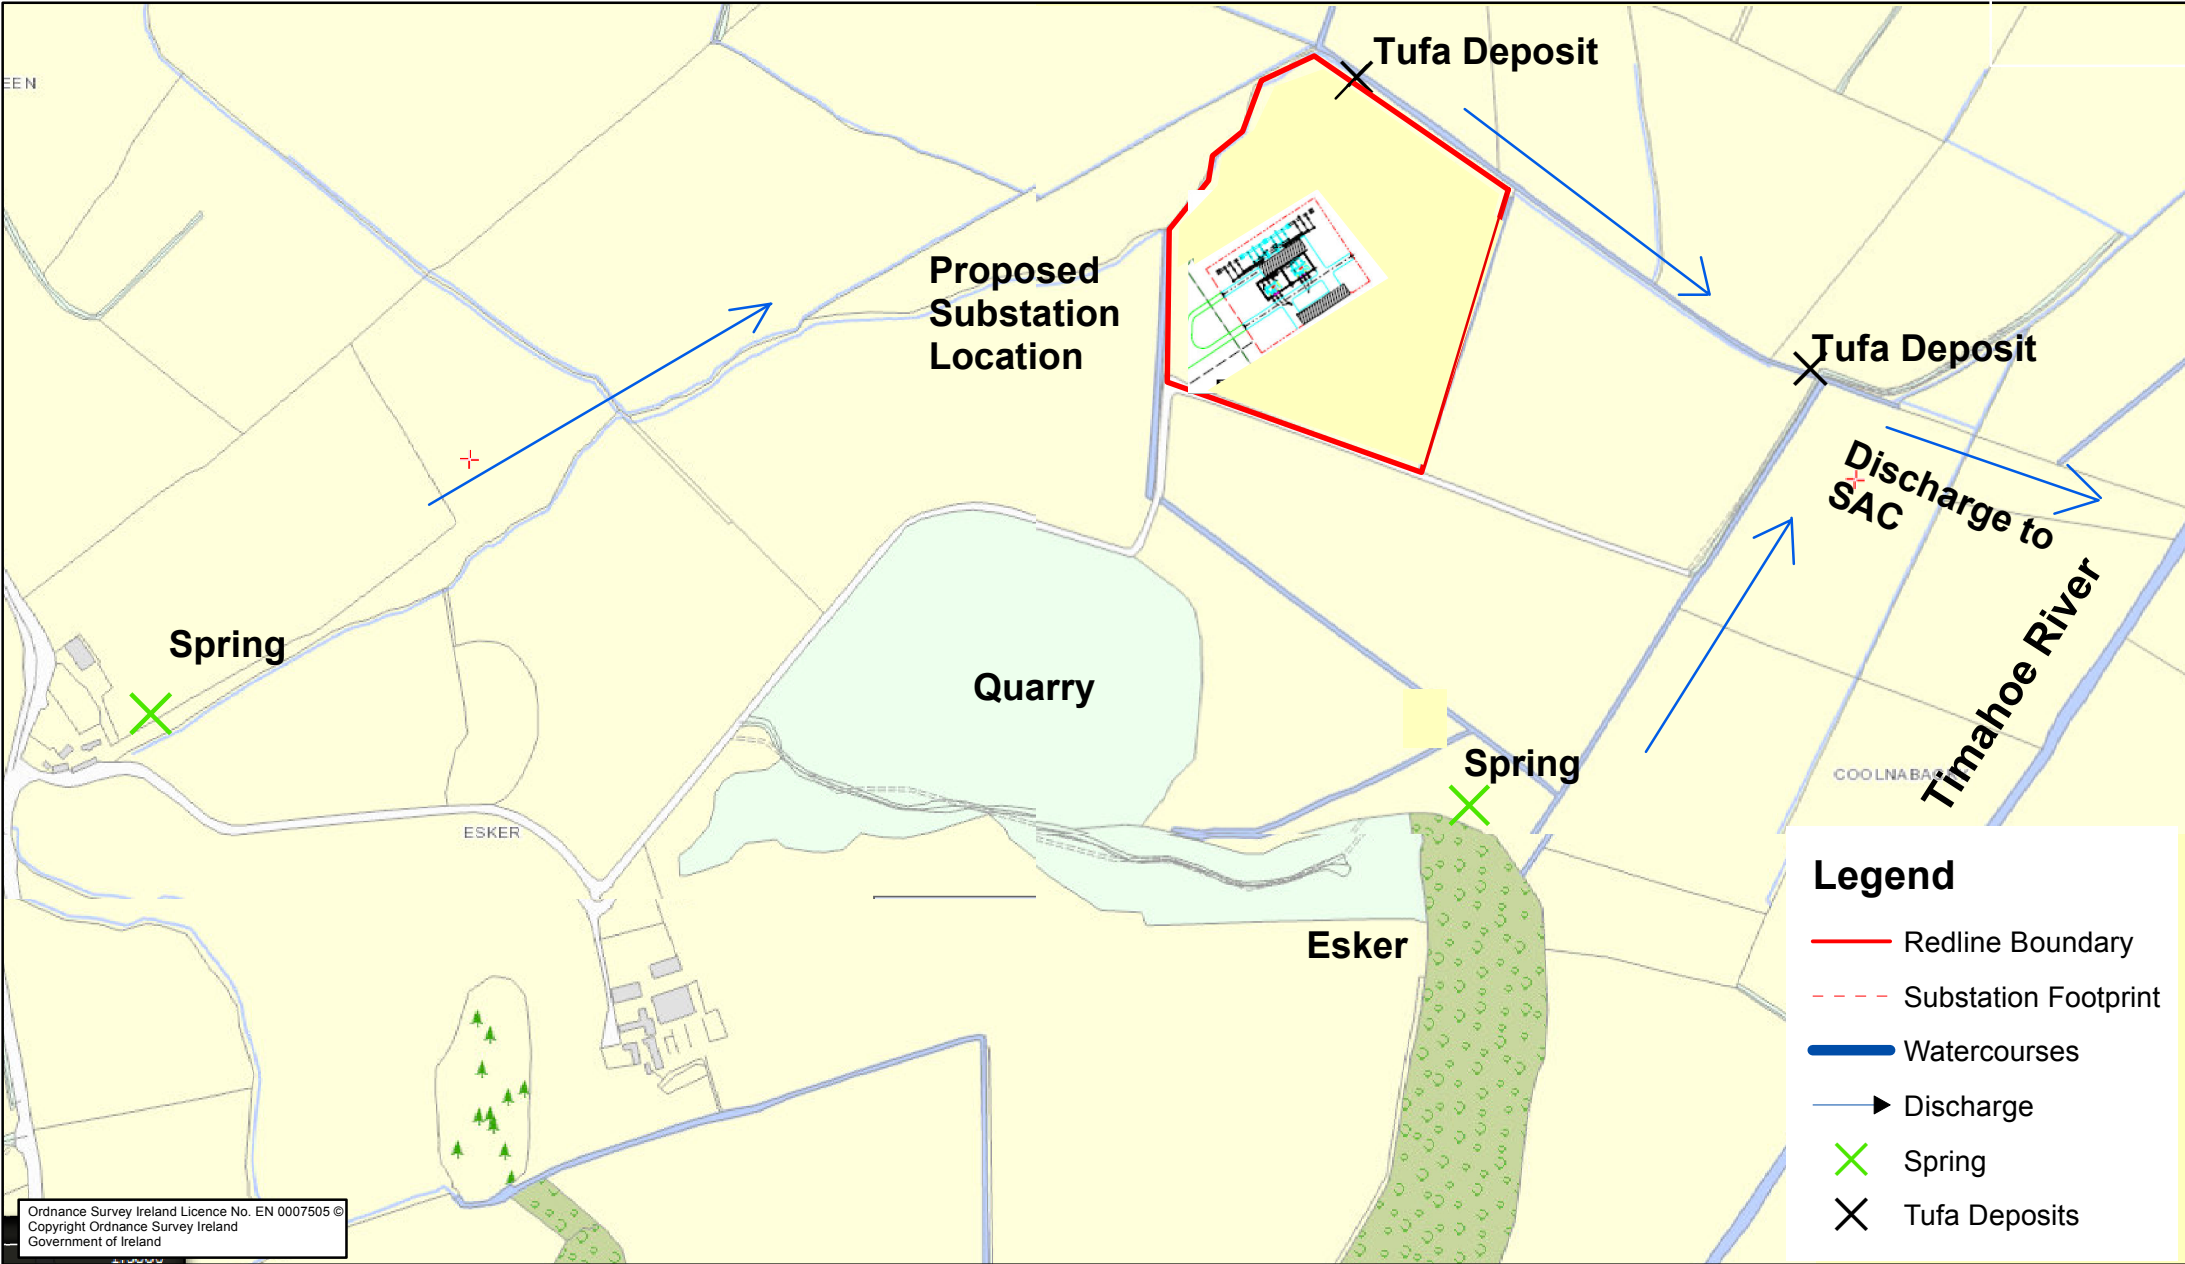

The depth to groundwater measured in the four boreholes on 19th June 2013 indicates that the depth to groundwater is consistent across the site at c.1m bgl. If there is any flow in the near surface deposits pore water, the surveyed groundwater levels indicate that flow will follow the topography to the east. Groundwater flow had been expected to be towards the south east, in the direction of the River.

Groundwater was also encountered in the clayey Sand and Gravel towards the centre of the site in the 2012 investigation, however most of the Sand and Gravel was found to be unsaturated.

4.0 IDENTIFICATION OF WATER ENVIRONMENT RECEPTORS

The following Water Environment receptors have been identified in the vicinity of the site, and are shown in Figures 4.1 and 4.2. The Water Environment receptors are:

- Groundwater in the gravel aquifer to the south of the site and the associated Kyle Spring PWS at distance from the site. There was no sand and gravel aquifer identified at the site;
- Groundwater in the underlying bedrock aquifer beneath the site;
- Tufa deposits along northern boundary of site;
- Tufa deposits to the north east of the site;
- Field drains along the site boundary which are part of the main headwaters of the Timahoe River;
- Timahoe River to the south east of the site;
- Spring associated with an esker to the south of the site;
- Spring at the head of the watercourse to west of site, and;
- Spring on head of watercourse to south of site.

The closest tufa deposit to the site is located over 100m from the boundary of the proposed excavation and is associated with the field drains. Clayey Sand and Gravel deposits were encountered towards the centre of the site, and ranging from 0.9 to 1.9m. The locations of the groundwater monitoring wells around the boundary of the site did not encounter sand and gravel.

The permeability tests in the groundwater monitoring wells indicate that the hydraulic conductivity is typical of silt and clay soils. Therefore, the water present in the deposits represents pore water, rather than groundwater. The Sand and Gravel deposits at the centre of the site which would be expected to have a higher permeability were found to be unsaturated.

The GSI maps show the gravel aquifer to extend to the south west of the site. The presence of eskers and gravel pits to the south west of the site further indicates that a greater thickness of Sand and Gravel deposits is expected in this area. Both tufa deposits are located at or near the boundary of the gravel aquifer and may be associated with discharge zones at the gravel aquifer boundary.

As noted above, the clayey sand and gravel deposits at the centre of the site were not found to be saturated during the site investigation. In most cases, groundwater strikes were not recorded in the deposits. As the Sand and Gravel was not saturated, this indicates that the quantities of groundwater present are not significant. The 2013 site investigation at the boundary of the site did not encounter groundwater strikes and confirm the presence of low permeability strata to the excavation depths.

Although for the wider groundwater body hydraulic continuity exists between the Sand and Gravel deposits and the bedrock aquifer, within the localised site area any groundwater and pore water in the clayey Sand and Gravel deposits and gravelly Clay will not be in hydraulic continuity with the bedrock aquifer underlying the site. This is demonstrated by the ground conditions encountered in borehole BH4, where stiff Clay was recorded to 8.6m bgl. The 2012 site investigation also proved significant thickness of low permeability Clay deposits, with up to 6.8m of clay proved beneath the clayey Sand and Gravel deposits. The Clay encountered during the site investigations is described as stiff to very stiff at depth, and this stiff Clay will impede any vertical groundwater flow.

As the permeability tests for the groundwater monitoring wells indicate that the groundwater present represents pore water, it may not be feasible to define a water table as lateral movement is impeded. The depth to groundwater measured in the four groundwater monitoring wells indicates that the depth to groundwater is consistent across the site at approximately 1m bgl. If there is any flow in the near surface deposits pore water, the survey groundwater levels indicate that this flow will follow the topography to the east.

4.2 Impact of Proposed Works on Hydrogeology

The proposed works include excavations to a maximum of 2.5m bgl at the building locations. An excavation of 2.5m is shown on the CSM and is located over 100m from the closest tufa deposit.

The excavations will extend through the clayey Sand and Gravel deposits (where encountered) into the underlying clay deposits. However, as discussed above the borehole logs indicate that the Sand and Gravel deposits are not saturated and groundwater strikes were not encountered in the groundwater monitoring boreholes

around the boundary of the site. Therefore, groundwater inflow from the clayey Sand and Gravel deposits is expected to be limited to the centre of the site.

Minimal groundwater inflows were encountered in the Clay deposits. As the permeability of these deposits is low, this will also impede the groundwater flow into the excavations. Groundwater levels were found to be approximately 1m bgl in the groundwater monitoring wells. Due to the presence of low permeability clay, across the site, any groundwater in the more permeable clayey Sand and Gravel deposits can be isolated during dewatering if necessary. This would minimise the impact on the local regime if unexpected additional gravel lenses were encountered during excavation.

As the groundwater flow into the excavations is expected to be limited, extensive dewatering is not anticipated during excavation and any impact on the water environment receptors is expected to be minimal. During construction should additional saturated gravel be encountered, the use of low permeability barriers to isolate and keep out groundwater in any surrounding Sand and Gravels. This will ensure that the short term impact of dewatering is localised to the area immediately surrounding the excavation.

5.0 CONCLUSIONS AND RECOMMENDATIONS

A number of water environment receptors have been identified in the vicinity of the site, including tufa deposits located at field drains on the boundary of the site and possibly associated with the boundary of the gravel aquifer.

The proposed excavation works at the Coolnabacky substation will extend for a maximum of 2.5m bgl and will intercept the shallow clayey Sand and Gravel deposits in places as well as Clay deposits.

Groundwater is present at c.1m bgl. Permeability tests carried out in the groundwater monitoring wells at the boundary of the site show that the hydraulic conductivity is in the range of low permeability silt and clay soils and may represent pore water rather than groundwater. Groundwater may be localised in clayey Sand and Gravels towards the centre of the site, however these deposits were mostly found to be unsaturated during the 2013 site investigation. It may not be feasible to define a water table as lateral movement is impeded. Should there be any flow in the near surface deposits pore water and clayey Sand and Gravels, this flow will follow the topography to the south east.

The impact on the water environment from any dewatering required during excavation is expected to be limited due to the following:

- 2012 Site investigation results indicate that the clayey Sand and Gravel deposits are not saturated and are localised in the centre of the site;
- Most groundwater strikes encountered in the 2012 site investigation were in the underlying low permeability clay deposits and during dewatering the inflow is expected to be limited;
- The 2013 groundwater monitoring wells did not encounter groundwater strikes during drilling and the permeability tests demonstrate the presence of low permeability material to excavation depths;
- Any groundwater in the more permeable clayey Sand and Gravel deposits at the centre of the site can be isolated during dewatering if necessary;
- Any dewatering can therefore be confined to the area immediately surrounding the excavation and will not impact on the local groundwater regime which supplies the tufa deposits or springs;
- The on-site clayey Sand and Gravel deposits are not in hydraulic continuity with the bedrock aquifer, and clay deposits have been proved to 8.6m bgl.

5.1 Mitigation Measures

The following mitigation measures are recommended to further protect the water environment receptors during construction:

Isolation of Groundwater Seepages

Borehole logs indicate that the clayey Sand and Gravel deposits present at the centre of the site are not saturated and groundwater flow into the excavation during construction is expected to be limited. However, should on-going dewatering be required during excavations it is recommended that a low permeability barrier be installed around the excavation walls where any Sand and Gravel deposits are encountered. This will ensure that any potential for drawdown that could affect the water regime including the watercourses and tufa deposits will be minimised.

Protection of Water Environment Receptors

The mitigation measures outlined in Section 10.0 (Water) of the Environmental Impact Statement (EIS) accompanying the planning application will ensure that no sediment contamination, contaminated runoff or untreated wastewater will enter any watercourses during the construction of the proposed line route. Given the presence of sensitive water environment receptors at the site, it is imperative that these mitigation measures are adhered to.

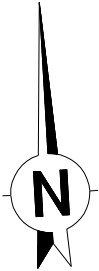

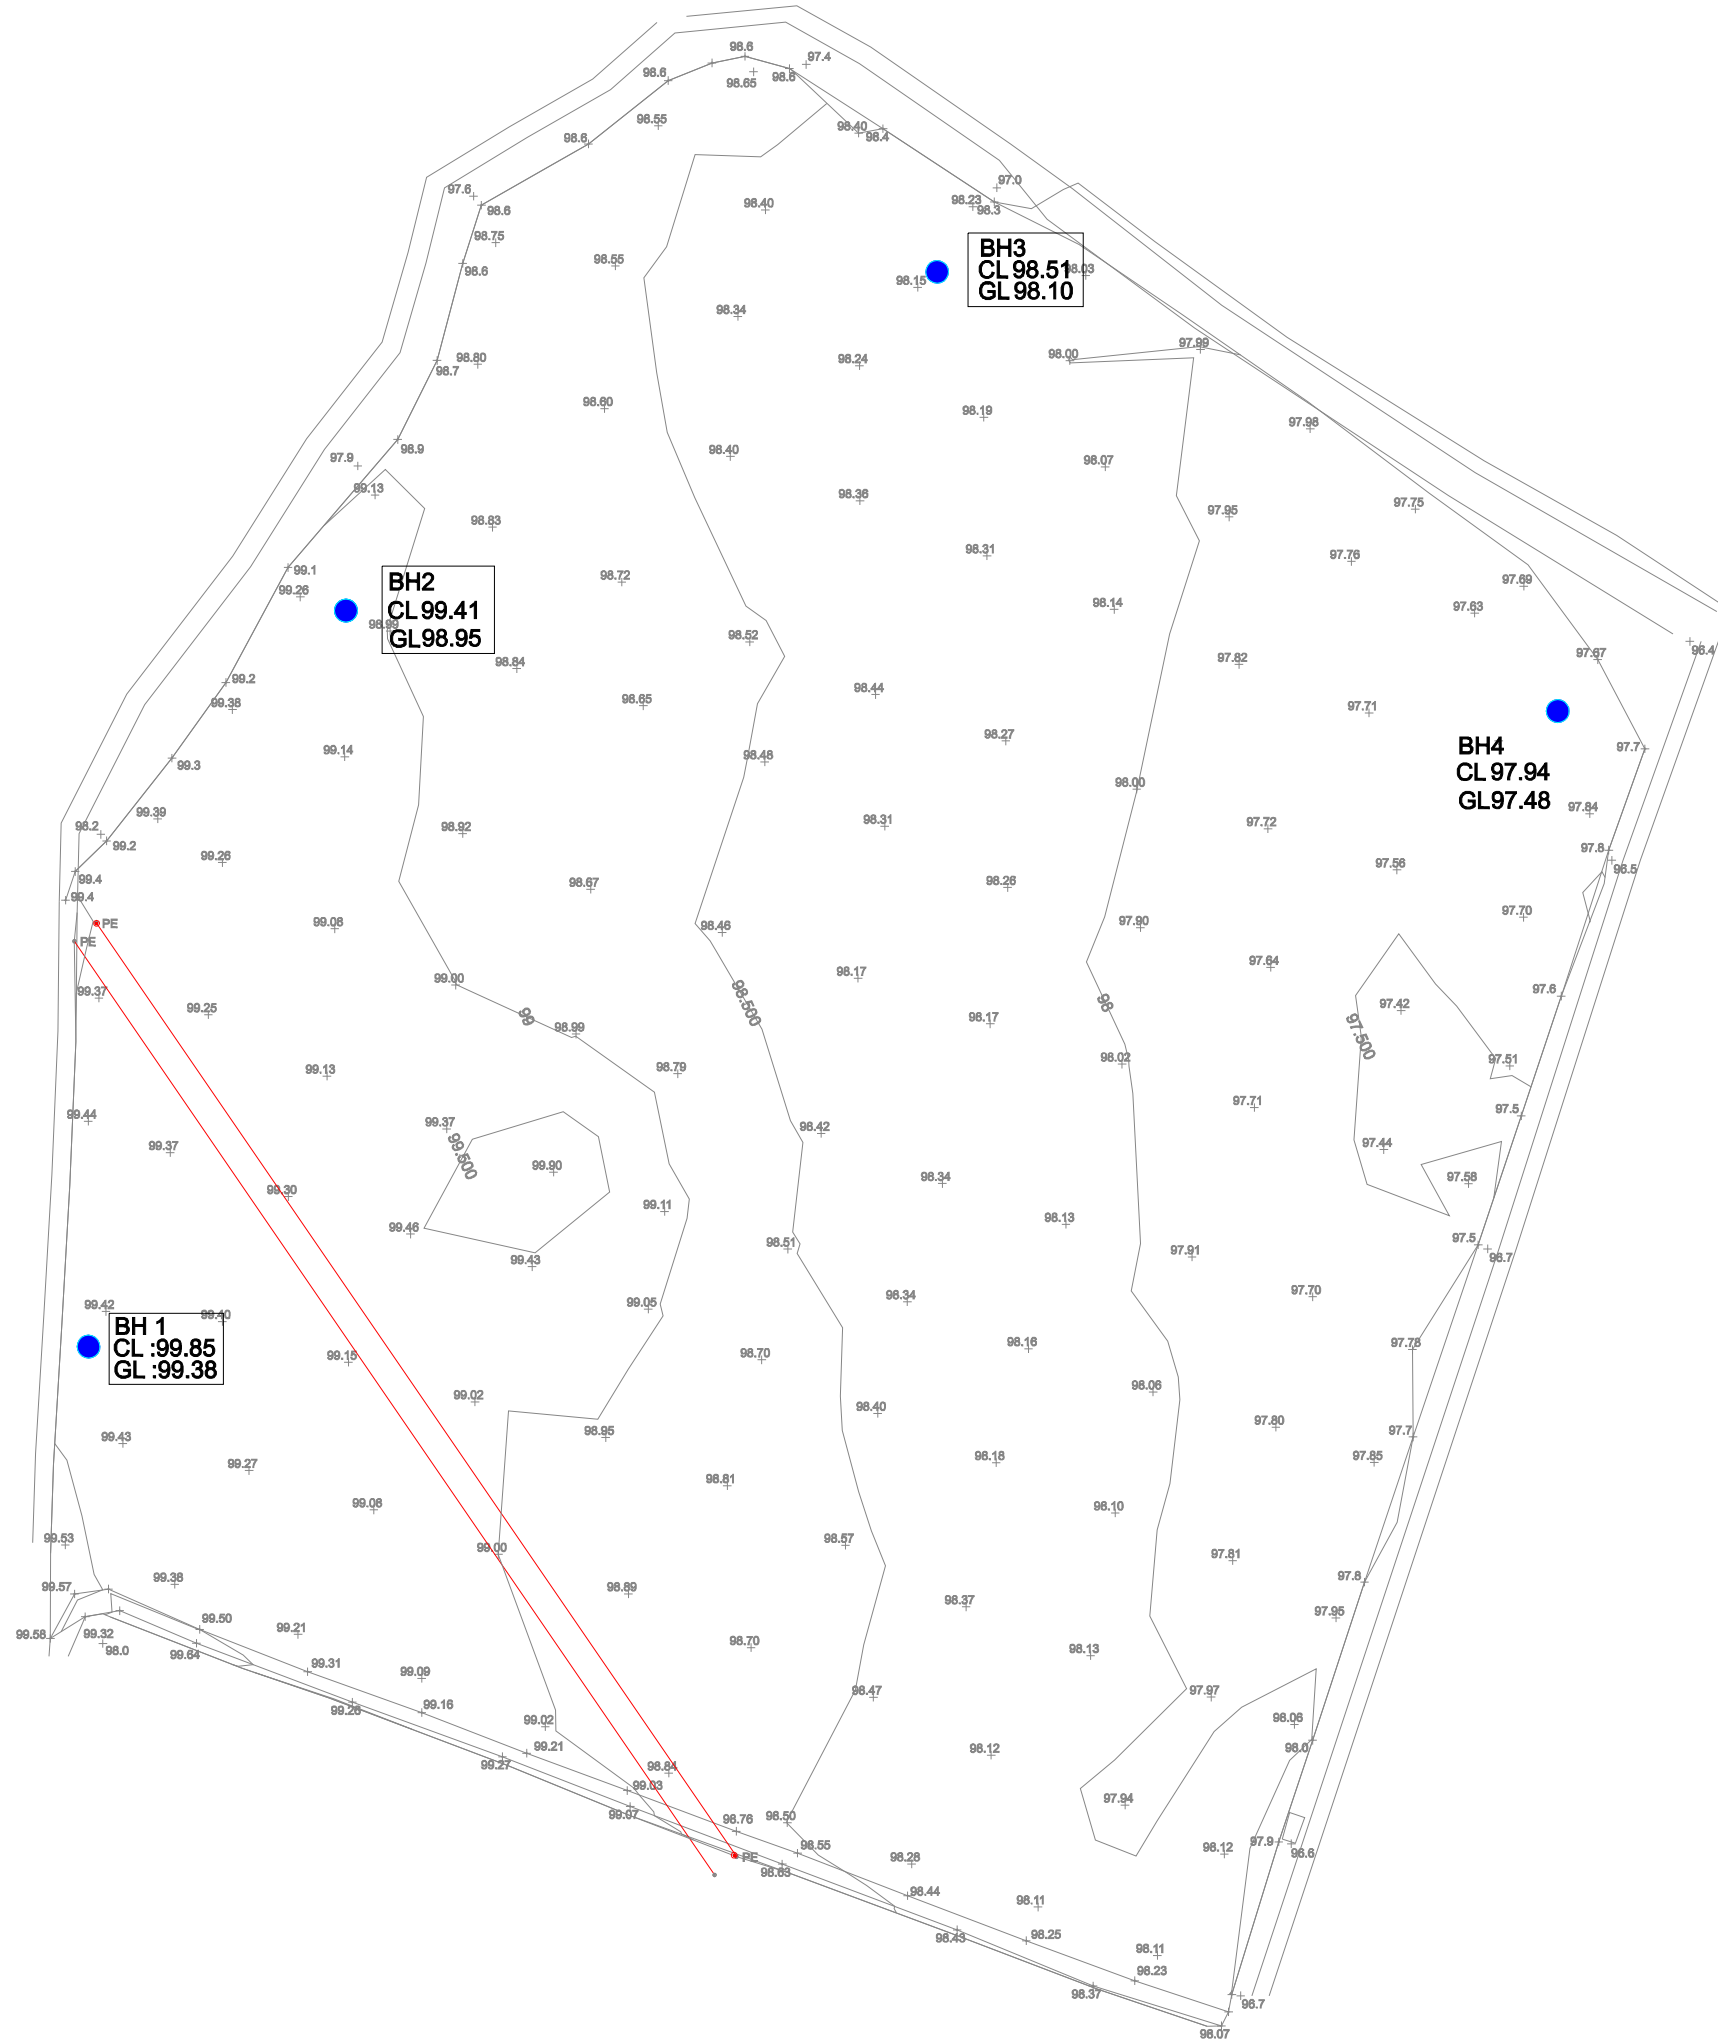

Provision of Buffer Zone

It is recommended that a 25m buffer zone is applied around the tufa deposits to ensure protection of the deposits. No works during construction and operation will occur within this area, including re-fuelling, batching of concrete or storage of fuels and soil stockpiles.

BH1 Groundwater Levels

Report Date: 08/08/2013 12:05:05
Report User Name: dcasey
Report Computer Name: AWN_DELL_NB172
Application: WinSitu.exe
Application Version: 5.6.22.4

Log File Properties:

File Name: BH2_2013-08-08_12-05-03-566.wsl
Create Date: 08/08/2013 12:05:00

Device Properties:

Device: Rugged TROLL 100
Site: Coolnaback BH 2 SN339178
Device Name:
Serial Number: 339178
Firmware Version: 1.01
Hardware Version: 0
Device Address: 1
Device Comm Cfg: 19200,8,Even,1,(Modbus-RTU)
Used Memory(%): 0
Used Battery(%): 1

Log Configuration

Log Name: BH2
Created By: btiernan
Computer Name: BTIERNAN-HP
Application: WinSitu.exe
Application Version: 5.6.24.4
Create Date: 20/06/2013 09:41:33 GMT Daylight Time
Log Setup Time Zone: GMT Daylight Time
Notes Size(bytes): 4096
Overwrite when full: Disabled
Scheduled Start Time: 20/06/2013 10:00:00 GMT Daylight Time
Scheduled Stop Time: No Stop Time
Type: Linear
Interval: Days: 0 hrs: 01 mins: 00 secs: 00

Level Reference Settings At Log Creation

Level Measurement Mode: Level Depth To Water
Specific Gravity: 0.999
Level Reference Mode: Set new reference
Level Reference Value: 1.44 (m)
Level Reference Head Pressure: 1000.25 (mBar)

Other Log Settings

Depth of Probe: 10.2096 (m)
Head Pressure: 1000.22 (mBar)
Temperature: 25.786 (C)

BH2 Groundwater Levels

Report Date: 08/08/2013 12:12:29
Report User Name: dcasey
Report Computer Name: AWN_DELL_NB172
Application: WinSitu.exe
Application Version: 5.6.22.4

Log File Properties:

File Name: BH3_2013-08-08_12-12-27-180.wsl
Create Date: 08/08/2013 12:12:24

Device Properties:

Device: Rugged TROLL 100
Site: Coolnaback BH 3 SN339278
Device Name:
Serial Number: 339278
Firmware Version: 1.01
Hardware Version: 0
Device Address: 1
Device Comm Cfg: 19200,8,Even,1,(Modbus-RTU)
Used Memory(%): 0
Used Battery(%): 1

Log Configuration

Log Name: BH3
Created By: btiernan
Computer Name: BTIERNAN-HP
Application: WinSitu.exe
Application Version: 5.6.24.4
Create Date: 20/06/2013 10:02:59 GMT Daylight Time
Log Setup Time Zone: GMT Daylight Time
Notes Size(bytes): 4096
Overwrite when full: Disabled
Scheduled Start Time: 20/06/2013 11:00:00 GMT Daylight Time
Scheduled Stop Time: No Stop Time
Type: Linear
Interval: Days: 0 hrs: 01 mins: 00 secs: 00

Level Reference Settings At Log Creation

Level Measurement Mode: Level Depth To Water
Specific Gravity: 0.999
Level Reference Mode: Set new reference
Level Reference Value: 1.44 (m)
Level Reference Head Pressure: 998.838 (mBar)

Other Log Settings

Depth of Probe: 10.1957 (m)
Head Pressure: 998.858 (mBar)
Temperature: 20.9253 (C)

Log Notes:
